## **1. FOREWORD**

The NERIS Platform (The European Platform on Preparedness for Nuclear and Radiological Emergency Response and Recovery) was established in June 2010 in Helsinki. The vision of the Platform was published in 2011 (<http://www.eu-neris.net/>). The Platform was established to be a forum where joint European arrangements for nuclear and radiological emergencies can be developed and improved in the future. The Platform addresses all notable trends, arrangements and capabilities in the area of response to and recovery from nuclear and radiological emergencies.

Since August 2012, the NERIS Platform is registered as a legal association under the French Law of the 1st of July 1901. Today, the NERIS association comprises 49 organisations, with 21 supporting organisations and is driven by a management board of 10 organisations. The participating organisations represent stakeholders with a wide range of backgrounds, e.g. authorities, emergency centres, research organisations and the academic community.

The main objectives of the NERIS Platform are to improve the effectiveness of current European, national and local approaches for preparedness concerning nuclear or radiological emergency response and recovery, promote more coherent approaches in Europe through the establishment of networking activities, maintain and improve know-how and technical expertise among all interested stakeholders in Europe by developing a supranational training programme, and to identify needs for further research and development and address new and emerging challenges.

The Platform intends to enhance confidence in the solutions, reduce overlapping work, produce savings in total costs of research and implementation, and make better use of existing competences and research infrastructures in Europe.

The NERIS Strategic Research Agenda (SRA) provides the basis for priorities regarding R&D (research & development), in particular the Key Topics to be dealt with in order to achieve the Vision. This document therefore communicates the future research & development needs, but will also be an instrument for creating synergies, co-operation and coordination internally between the NERIS participants and externally with activities taking place within the European Joint Programming for Radiation Protection Research and within other international forums.

## **2. INTRODUCTION**

A total of 183 nuclear power reactors are operational in Western, Central and Eastern Europe today [1], as well as many other nuclear facilities, such as research reactors. In addition to this, transports of radioactive materials are organized on a regular basis throughout European countries. Being aware that every man-made facility, equipment or activity is always at risk for malfunction or an accident, it is more than likely that bigger or smaller nuclear or radiological incidents and accidents may happen in the future. Significant efforts for the safety of nuclear installations in Europe have been achieved, but when the risk comes true it will have multidimensional consequences in the society. The accident at the Fukushima Daïchi nuclear power plant has reinforced the concern of all stakeholders on this issue and called for an improvement of the safety as well as the preparedness for managing short and long term consequences of nuclear events. Furthermore, it demonstrated that accidents at large distances from Europe, 448 nuclear power reactors are operational worldwide [1], call for response within Europe to protect European Citizens in the affected regions, to provide assistance to the affected countries and to monitor economic activities such as the import of foods or contaminated goods.

Apart from nuclear facilities, there are thousands of smaller installations using radioactive sources and materials. Of course, incidents and accidents in connection with these facilities would have more limited radiological consequences compared with big nuclear facilities. However, sources could possibly be stolen or bought by persons with malicious intent and purposely applied in devices designed to harm people and create anxiety and disruption. These possibilities stress the links between safety and security issues.

Nuclear and radiological safety and security have common goals. In the past 25 years, major progress has been made at the International, European, national and regional levels in the management of response to and recovery from nuclear and radiological emergencies. Notwithstanding the provisions now in place in most European countries and internationally, complacency would be misplaced and continuing vigilance remains important. Improvements, of a technical, organisational or political nature supported by important R&D efforts are still needed in emergency management. In addition, general technological evolutions such as the increasing computer power, the growth of social networks, big data and the availability of low cost radiation monitoring capabilities bring challenges for emergency management, not existing a decade ago.

The accident at the Fukushima Daïchi nuclear power plant in Japan in March 2011 proved that an event regarded as almost impossible was possible and a very small risk became reality. The Fukushima accident also demonstrated that consequence assessments and actions were needed also in Europe although the accident itself happened far away. In connection of remote accidents, European authorities and decision makers have to react to protect their own citizens staying close to the accident site. The more coherent the decisions are in different European countries the more confidence they arouse among the public.

Europe is a heterogeneous array of independent and sovereign countries having different cultural and political background and polity. The countries also have different threats as far as nuclear or radiological emergencies are concerned depending on their geographical location and distance from major nuclear installations. Therefore attempts to implement Europe-wide arrangements, in operational way, in the use of compatible systems and tools in radiation monitoring, decision making, and in communication between different actors is very complex. Interactions with scientific, technologic, economic and social areas and involvement of competent authorities at national and European levels are necessary. Thus, a full set of competencies is needed to address the challenges of conducting necessary actions in a nuclear or radiological emergency and recovery at local, national, regional and European levels.

R&D in the field of nuclear emergency preparedness, response and recovery including different disciplines is in the above mentioned context of utmost importance to further improve the operational management of nuclear and radiological threats.

### **3. FRAMEWORK OF THE STRATEGIC RESEARCH AGENDA (SRA)**

An integral part of the mission of NERIS is to identify gaps and needs for further research and developments and addressing new and emerging challenges in the field of preparedness for nuclear or radiological emergency response and recovery. The Strategic Research Agenda (SRA) of NERIS, coordinated by the NERIS R&D Committee, identifies the research areas and topics important for improving the nuclear and radiological emergency management in the preparedness, response and recovery phase of an accident. An overview of the different phases considered and related terminology used within the SRA is given in Figure 1.

Figure 1. The different phases and terminology used in emergency management and recovery. It has to be noted that different phases can take place in different locations at the same time, and some phases can be missing depending on the nuclear or radiological event. (Terminology adopted in General Safety Guide GSG-11, IAEA in blue/ Terminology adopted by ICRP in green)

The NERIS SRA has a clear focus on **off-site** emergency preparedness, response and recovery. However, it does not exclude links with on-site emergency preparedness and response. Emergency management has many different perspectives. As NERIS is a radiation protection platform, this SRA focuses on the radiation related aspects of nuclear and radiological emergency management, but also includes non-radiological aspects such as socio-economical and ethical factors, not excluding links with other perspectives.

The following threats were identified. These are in general considered as potential nuclear and radiological events for which emergency preparedness, response and recovery is required:

- ▶ Incidents and accidents (including criticality accidents) in Nuclear Installations (Power generation, research reactors, *etc.*)
- ▶ radioactive waste repositories;
- ▶ Transport accidents of radioactive material;
- ▶ Lost/orphan sources;
- ▶ Terroristic threats involving radioactive material/ionizing radiation;
- ▶ Military installations and operations (including submarines);
- ▶ Satellite re-entry with radioactive sources;
- ▶ Other events involving the non-controlled exposure or spread of radioactivity (Hospitals, Medical & Industrial Isotope Production Facilities, Space Weather, *etc.*).

Decision support systems, such as ARGOS and JRODOS have been developed over the past decades and are regularly updated with new tools, developments and demands from end-users. They focus on simulation models for all phases of an emergency, impact assessment, countermeasure strategies, consequence assessment and application at various levels of decision making (local to national). Stakeholder engagement related to the evaluation of countermeasure strategies is an important aspect for the realisation of management options in the simulation models.

### **3.1. Process of development of the Strategic Research Agenda (SRA)**

A short history of the NERIS SRA development is given in Annex 1. The current version of the NERIS SRA is based on:

- ▶ Discussions within the NERIS R&D Committee meetings. The current composition of the NERIS R&D Committee can be found on the NERIS website (<http://www.eu-neris.net/>);
- ▶ Results and insights gained by past and running European projects: NERIS-TP [4], PREPARE [5], SHAMISEN, ENGAGE, CONFIDENCE, TERRITORIES;
- ▶ Identified operational challenges: e.g. linked to the European Basic Safety Standards and international recommendations such as the ICRP. Operational and general challenges are also addressed in the NERIS working groups;
- ▶ Discussions and outcomes of the NERIS working groups, currently defined as:
  - Working Group N°1 on the practical implementation of the ICRP recommendations on emergency and rehabilitation;
  - Working Group N°2 on processes and tools for emergency and rehabilitation preparedness at community level;
  - Working Group N°3 on contaminated goods;
  - Working Group N°4 on Information, Participation and Communication.
- ▶ Findings from work presented at the NERIS Workshops 2016 [6], 2017 [7], and 2018 [8];
- ▶ Findings from work presented and meetings during the 2016, 2017 and 2018 European Radiation Protection Week.
- ▶ Consultation with NERIS Supporting Organisations, the members of the CONCERT stakeholder group, the associated CONCERT Projects leaders, and Research Platforms correspondents.

The current update of the NERIS SRA is largely done in context of the ‘CONCERT-European Joint Programme for the Integration of Radiation Protection Research’ under Horizon 2020 (<http://www.concert-h2020.eu/>)

### **3.2. Identifying, characterizing and prioritizing of topics of SRA**

The structure and the topics included in this version of the SRA are largely based on the previous version (NERIS SRA version 4 of 22 December 2017). Three key areas are defined with a total of 10 key topics. An overview is given below and a detailed discussion of the key topics is found in the next section.

#### **Research area 1. Challenges in radiological impact assessment during all phases of nuclear and radiological events**

Within this area all research challenges are aimed to improve the radiological impact assessment in all phases of a nuclear or radiological event. It includes improvements in modelling, monitoring and the combination of both (data assimilation for e.g. source term estimation) for human dose and environmental impact assessment. This includes research related to impact assessments for planning, real-time impact assessments during the response phase, dose reconstruction in a later phase, uncertainty quantification of the impact assessment and visualization.

#### **Research area 2. Challenges in countermeasures and countermeasure strategies in emergency & recovery, decision support & disaster informatics**

This research area covers all challenges related to decisions on and implementation of protective actions during an emergency, including justification and optimization. It comprises: countermeasures and countermeasure strategies including lifting of countermeasures and transition from emergency to existing exposure situation; formal decision support, including multi criteria analysis and disaster informatics; the study of the use of information technology in the preparation, mitigation, response and recovery phase of a nuclear or radiological disaster.

#### **Research area 3. Challenges in setting-up a trans-disciplinary and inclusive framework for preparedness for emergency response and recovery**

The third research area focuses on the overall emergency response and recovery framework, including reference levels, stakeholder engagement, the involvement of the public, communication research and non-radiological perspectives such as health, ethical and societal aspects. This area also integrates multi-disciplinary research to cope with incomplete information, typical for of emergency situations, and improved decision making under high uncertainty.

#### 4. KEY TOPICS OF THE STRATEGIC RESEARCH AGENDA (SRA)

##### Research area 1. Challenges in radiological impact assessment during all phases of nuclear and radiological events

The following key topics and subtopics are defined:

Area 1. Key topics	Sub-topics
<b>Key topic 1. Improved modelling</b>	Atmospheric transport and dispersion modelling (ATM/ADM)
	Hydrological transport modelling
	Dose modelling
	Environmental modelling
<b>Key topic 2. Improved monitoring</b>	Monitoring techniques and strategy
	Data collection & sharing
	Optimisation
<b>Key topic 3. Data assimilation</b>	Improved source term estimation
	Improved impact assessment
	Big Data, Data fusion

### Key topic 1. Improved modelling

**Objective:** To make more reliable and accurate forecasts on dispersion of radioactive materials in different media, human radiation doses and effects on the environment, taking into account uncertainties

**Expected results:** Models and Decision Support Systems (DSSs) with extended capabilities.

Sub-topic	Description and current research challenges within this (sub)topic	Relation with recent & running projects and other SRA's
<b>Atmospheric transport and dispersion modelling (ATM/ADM)</b>	<p>ATM/ADM at different scales and complexity is the basis for the impact assessment of releases to the atmosphere as well in the planning phase (preparedness), the response phase and for dose reconstruction. It includes forward (prognostic) modelling as well as inverse modelling (e.g.; source term reconstruction). Currently following challenges are identified:</p> <ul style="list-style-type: none"> <li>• <b>Modelling approaches for complex settings (urban or confined spaces):</b> development of models for the intentional or accidental releases of radiological or nuclear material in complex environments (e.g.; urban, near range). Combination of complex (e.g.; CFD- Computational Fluid Dynamics) modelling with more simple approaches;</li> <li>• <b>Non-conventional emissions:</b> extension of capability of dispersion models in existing DSSs to treat detailed information for particular types of sources (e.g.; explosions, two-phase, aerosol sprays, fires, general short-term releases), and to simulate dispersion of particular substances (aerosol, phase-changing, particles with spectrum of different size, chemical transformations); And specific scenarios such as transport of sources, releases from waste repositories, etc.</li> <li>• <b>Fine-tuning modelling parameters and algorithms:</b> Extension of capability of dispersion models in DSSs to treat phenomena that currently are not fully considered, in particular for low wind speed, very stable conditions, high precipitation and different forms of precipitation.</li> <li>• <b>Uncertainty quantification:</b> ensemble calculations, Quantification/assessment of ATM/ADM uncertainties: uncertainties due to input meteorological data, through the use of e.g., meteorological ensemble forecasts; uncertainties due to other input data (source term, physical properties of dispersed material, etc.); uncertainties due to modelling assumptions / approximations / parameterizations; uncertainties due to natural variability of the atmosphere / assessment of probability density functions / highest or most probable expected values for concentration, exposure, etc.; ensemble dispersion modelling</li> </ul>	<p>Projects: PREPARE, HARMONE, CONFIDENCE</p>

Sub-topic	Description and current research challenges within this (sub)topic	Relation with recent & running projects and other SRA's
<b>Hydrological transport modelling</b>	<p>Dispersion modelling in different hydrological systems is the basis for impact assessments of liquid releases and atmospheric releases with deposition resulting in aquatic contaminations in the planning phase (preparedness), response phase, for reconstruction and for guiding recovery. Currently following challenges are identified:</p> <ul style="list-style-type: none"> <li>• <b>Urban hydrology</b> <ul style="list-style-type: none"> <li>○ Contamination of urban fresh water supply: Development and implementation in existing DSSs of models to predict the activity concentrations in the urban fresh water supply system due to contamination of freshwater basins from radioactive cloud;</li> <li>○ Waste water from urban decontamination: Development and implementation in existing DSSs of models to estimate the activity concentration in the waste water due to washout of deposited radionuclides in urban areas;</li> <li>○ Better representation of wash-off processes linked to actual or prognostic information on precipitation events (plus essentially the same for food producing areas).</li> </ul> </li> <li>• <b>Models for coastal areas:</b> Development and implementation of relocatable hydrodynamic 3D models of coastal circulation for real time predictions of transport of radioactivity in the coastal zone;</li> <li>• <b>Coupling with weather forecast models:</b> Coupling with weather forecast models to provide forcing for wave models;</li> <li>• <b>Runoff to sea:</b> Coupling with runoff (land to river to sea) models for the emergency phase and long term phase calculations in the case when the power installation is located near the coast – combination with deposition maps of fall-out on the land near the coast;</li> <li>• <b>Uncertainty quantification:</b> As for atmospheric dispersion, uncertainties have to be quantified for the hydrological models. This includes approaches for transport and dispersion models as well as approaches for the integrated food chain as is typically the case for box models. Here the movement of the marine species between boxes has to be considered</li> </ul>	<p>Projects: PREPARE Platforms: ALLIANCE</p>

Sub-topic	Description and current research challenges within this (sub)topic	Relation with recent & running projects and other SRA's
<b>Dose modelling</b>	<p>Dose models aim at estimating the dose to humans (retrospective and/or predictive: e.g.; first year dose) in different environments (urban, agricultural, forest, ...) and conditions (normal living, applying certain countermeasures, ...)</p> <ul style="list-style-type: none"> <li>• Intercomparison between different models;</li> <li>• Evaluation of dose models along available data from past accidents;</li> <li>• Extending dose modelling to a wider range of radiological events (criticality) and exposures (direct exposure, cloud shine);</li> <li>• Development of dose models for population movement;</li> <li>• Impacts of population changes over time.</li> </ul>	<p>Projects: HARMONE, TERRITORIES, CONFIDENCE</p> <p>Platforms: EURADOS</p>
<b>Environmental modelling</b>	<p>Modelling the behaviour and the effect of radioactive substances in the biosphere. It comprises source term and release, transport through the abiotic part of the biosphere, food chains, intake and distribution in humans and the effect of radiation on living organisms. Here are excluded the atmospheric and hydrological dispersion.</p> <p>Currently following challenges are identified:</p> <ul style="list-style-type: none"> <li>• <b>Marine food chain</b></li> <li>• <b>Customising of the existing environmental models into the regional circumstances in Europe (close co-operation with the Radioecology Alliance):</b> revision of model parameters as FDMT<sup>1</sup></li> <li>• <b>Local radio-ecological models:</b> Development of local radio-ecological models interlinked with monitoring information and the more global and food chain dose models, integrated in general DSS;</li> <li>• <b>Multiple stressors:</b> Models able to tackle multiple stressors in the assessment of countermeasure strategies and in relation to malicious dispersion (CBRNE);</li> <li>• Process based models (extension to non-common radionuclides)</li> </ul>	<p>Projects: PREPARE HARMONE TERRITORIES CONFIDENCE</p> <p>Platforms: ALLIANCE</p>

<sup>1</sup> FDMT software : Food Chain and Dose Module for Terrestrial Pathways

## Key topic 2. Improved monitoring

**Objective:** Improve monitoring capabilities and efficiency in emergency and post-emergency/existing situations

**Expected results:**

- ▶ Optimized monitoring and monitoring strategies;
- ▶ Improved link between modelling efforts and monitoring efforts.

Sub-topic	Description and current research challenges within this (sub)topic	Relation with recent and current running projects and other SRA's
<b>Monitoring techniques &amp; strategies</b>	<ul style="list-style-type: none"> <li>• <b>The further development and integration of novel techniques and methods</b> for the measurement of radiation and radioactivity, such as drones, small detector devices and smartphone apps, retrospective dosimetry, etc. will become very important in the next decades in nuclear and radiological emergencies;</li> <li>• <b>The further development and integration of existing techniques</b> of key importance for the monitoring of persons, such as whole body, thyroid, lung counting;</li> <li>• <b>Improved assessment of measurement uncertainties in the field during emergency monitoring;</b></li> <li>• <b>Development of improved measurements strategies supporting and tailored to decisions;</b></li> <li>• <b>Optimised use of monitoring resources</b>, including mobile units and trans-border issues. Use of new monitoring technologies;</li> <li>• <b>Development of processes and tools for integrating the monitoring results</b> from experts and lay people into a common operational picture (monitoring crowdsourcing) Information fusion (radiological and non-radiological);</li> </ul>	Platforms: EURADOS
<b>Data collection</b>	<ul style="list-style-type: none"> <li>• <b>Data collection for model validation:</b> Availability of data are crucial for validating models, such as for example a program for resuming measurements of Chernobyl contaminants on different surfaces (and if possible Fukushima-measurements). Other data from routine releases, small incidents or obtained by controlled experiments (e.g.; RDD's) for model validations. Implementation of new experimental campaigns;</li> <li>• Establish an <b>overview</b> of / <b>guidance</b> on which data should be collected <b>for recovery operations</b> to be considered;</li> <li>• <b>New meteorological data:</b> optimised use of new meteorological instruments (E.g.; Lidar, ..) with evaluation of application to improve modelling.</li> </ul>	Projects: HARMONE, SHAMISEN-SINGS

Sub-topic	Description and current research challenges within this (sub)topic	Relation with recent and current running projects and other SRA's
<b>Optimisation</b>	<ul style="list-style-type: none"> <li>• <b>Optimized use of specific monitoring resources</b> for nuclear and radiological emergencies (early warning networks, mobile teams, laboratories, ...), in function of protective actions and decision support;</li> <li>• <b>Optimization of early warning networks and other monitoring resources</b>, including aerial surveys taking into account new technologies, such as the potential use of drones.</li> </ul>	Projects: DETECT

### Key topic 3. Data assimilation

**Objective:** Source term estimation based on monitoring and inverse modelling, combining monitoring and modelling effort to decrease uncertainty on impact assessments.

**Expected results:** better source term reconstruction and operational data assimilation techniques, reduced uncertainty allowing improved protective actions and countermeasure strategies.

Sub-topic	Description and current research challenges within this (sub)topic	Relation with recent and running projects and other SRA's
<b>Improved source term estimation</b>	<ul style="list-style-type: none"> <li>• <b>Rapid analytical tools:</b> Development of rapid analytical tools in combination with mobile and automated equipment to assess source terms and contamination levels in a short time frame;</li> <li>• <b>Advanced source term estimation methods:</b> Further development of advanced operational source term estimation computational methods – including unknown source location - combining inverse modelling with data assimilation of observations. Of special interest are operational data assimilation methods for estimation of unknown source location and strength in urban (i.e., complex) environments. Research is needed on the effects of modelling and measurement uncertainties that enter in the data assimilation methods;</li> <li>• <b>Combined ensemble dispersion modelling with data assimilation.</b></li> </ul>	Projects: PREPARE
<b>Improved impact assessment</b>	<ul style="list-style-type: none"> <li>• <b>Combining different types of measurements in the data assimilation for improved assessment of impact or estimation of source term</b> – ranking types of measurements, including the uncertainty of measurement results and phase of accident;</li> <li>• <b>Data assimilation models:</b> Development of operational data assimilation methods and models for doses and concentrations (aiming at “correcting” parameters other than source term). In particular for areas without dense monitoring and in the time when monitoring is still limited: quantification of uncertainties in the assessed concentrations and doses depending on the amount and quality of available observations; integration of such methods in DSS.</li> </ul>	Projects: CONFIDENCE
<b>Big data, data fusion</b>	<ul style="list-style-type: none"> <li>• <b>Employment of advanced Information Technology instruments</b> to develop computational structures (e.g., platforms, aggregators) that would allow storing, processing and combining large volumes of heterogeneous and of different origins data (modelling, observational) for purposes like unknown source term estimation, radiological impacts assessment, etc.</li> <li>• <b>Further development of platforms and protocols for sharing and exchange of data, taking into account different existing data formats such as EURDEP/IRIX</b></li> </ul>	Projects: SHAMISEN-SINGS

**Research Area 2. Challenges in countermeasures and countermeasure strategies in emergency & recovery, decision support & disaster informatics**

The following key topics and subtopics are defined:

Area 2. Key topics	Sub-topics
<b>Key topic 4. Countermeasures and countermeasure strategies</b>	Countermeasures/management options
	Implementation and monitoring of countermeasures, including lifting of countermeasures
	Consequence assessment, justification and optimisation of countermeasure strategies
<b>Key topic 5. Formal decision support</b>	Decision making, methods and tools
	Decisions under high uncertainty
<b>Key topic 6. Disaster informatics</b>	Analytical platform
	Knowledge database
	DSS interface, output and coupling
	Serious gaming

#### Key topic 4. Countermeasures and countermeasure strategies

**Objective:** Development of flexible and user friendly simulation models that allow the definition of sensible countermeasure strategies by combining individual management options. In addition improvement of understanding of processes related to countermeasures (e.g. movement of contamination, parameter selection for different environment). Models have to be improved to allow also for estimation of termination of countermeasures based on criteria that have to be defined. Identification, characterisation and assessment of the response of the actions (management options) and strategies to mitigate the consequences of a radiological or nuclear event. Analyses of behavioural aspects, such as self-evacuation, self-initiated protective actions on countermeasure effectiveness

**Expected results:** Improved countermeasure models fit for purpose.

Sub-topic	Description and current research challenges within this (sub)topic	Relation with recent and running projects and other SRA's
<b>Countermeasures &amp; countermeasure strategies</b>	<ul style="list-style-type: none"> <li>• <b>Revision of the European handbooks:</b> Generic revision and revision of European handbook sections (creation of addendum) for consideration of malicious dispersion scenario's;</li> <li>• <b>Countermeasure strategy preparedness:</b> Development of sustainable preparedness strategy at local, national and European level, based on the analyses of countermeasures for relevant accident scenarios, ensuring that parameters governing the radiological consequences can be identified in time to enable optimized remediation;</li> <li>• <b>More detailed studies and evaluations of countermeasure effectiveness,</b> especially if several countermeasures are combined, or impact from other environmental and external conditions</li> </ul>	Projects: PREPARE, CONFIDENCE Platforms: ALLIANCE
<b>Implementation and monitoring of countermeasures, including lifting of countermeasures</b>	<ul style="list-style-type: none"> <li>• <b>Development of tools for the usage at the local level:</b> Analyse the need of the local actors in respect to local-national interaction, for implementation of mitigating actions in response and recovery phases. Compatibility of local and national tools.</li> <li>• <b>Timeline of implementation;</b></li> <li>• <b>Termination and withdrawal of protective measures:</b> Development of framework and guidance for setting up criteria to lift in particular early phase countermeasures. This includes guidelines for returning people but also compensations schemes.</li> <li>• <b>Feedback on decision / action effectiveness:</b> Feedback on the use of methods and tools to monitoring of situation and evaluate the effectiveness of protective actions. Simple measurement strategies are needed to secure that CM's implementation is optimised in practice. If this is not done, a 'paper-optimised' strategy may well fail completely in practice;</li> </ul>	Projects: NERIS-TP, PREPARE, CONFIDENCE

Sub-topic	Description and current research challenges within this (sub)topic	Relation with recent and running projects and other SRA's
<b>Consequence assessment and optimisation of countermeasure strategies</b>	<ul style="list-style-type: none"> <li>• <b>Consequence assessment:</b> Establishment of evaluation criteria and their metrics to estimate the consequences of the action alternatives; qualitative and quantitative methods; consideration of the uncertainty;</li> <li>• <b>Optimisation:</b> Development and application of criteria, indicators and methods to optimise the management options and/or the protective strategies.</li> </ul>	Projects: NERIS-TP, PREPARE, CONFIDENCE, TERRITORIES

### Key topic 5. Formal decision support

**Objective:** Improvement of the decision making process by using tools to structure the process and support the selection of appropriate options.

**Expected results:** new methods and tools that can be used by decision makers at all levels of the decision making process.

Sub-topic	Description and current research challenges within this (sub)topic	Relation with recent and running projects and other SRA's
<b>Decision-making, methods and tools</b>	<ul style="list-style-type: none"> <li>Structuring the decision processes at national, regional and local levels with the help of formal decision aid tools, such as multi-criteria analysis;</li> <li>Development of guidance on the use of DSS based on feedback from stakeholder processes and from Fukushima experience in emergency response and recovery;</li> <li>Development of Machine Learning techniques for decision making.</li> </ul>	Projects: PREPARE, CONFIDENCE, TERRITORIES
<b>Decision under high uncertainty</b>	<ul style="list-style-type: none"> <li><b>Assessment and communication of uncertainties:</b> Investigation of data uncertainties (model or monitoring results), how they are transferred in chains of successive models and how they can be communicated or presented, e.g. in model results and in DSS to help decision-makers to understand the radiological situation;</li> <li>This also includes work on model sensitivity, validity of model results and inter-comparisons of models and measurements</li> <li>How uncertainties influence optimization process</li> </ul>	Projects: CONFIDENCE

### Key topic 6. Disaster informatics

**Description:** Study of the use of information and technology, including artificial intelligence, in the preparation, mitigation, response and recovery phases of disasters and other emergencies.

**Objective:** Development of databases and methods to support decision making when little information is given and assessments with simulation models are very uncertain. This should be based on historic experience and/or scenarios that can be processed by DSS. Further to this, a coupling of the strategic tools (e.g. DSS) with tools from first responders (e.g. Command and Control) that have to carry out recommendations is of interest. Use of Artificial Intelligence methods.

**Expected results:** Knowledge databases and tools that use existing knowledge to support decision making when little information is available and also supports the first responder in considering resources when recommending countermeasures.

Sub-topic	Description and current research challenges within this (sub)topic	Relation with recent and running projects and other SRA's
<b>Analytical platform</b>	<ul style="list-style-type: none"> <li>• <b>Access/exchange platform</b> collecting and distributing results from governmental and non-governmental organisations;</li> </ul>	Projects: PREPARE
<b>Knowledge database</b>	<ul style="list-style-type: none"> <li>• <b>Development of a knowledge database</b> with scenarios and response, including lessons learned from historic events and decision support tools developed in international handbooks such as the European handbooks;</li> <li>• <b>Development of information material</b> of general nature on radiation emergencies, countermeasures and recovery based on lessons learnt from past events.</li> </ul>	Projects: PREPARE
<b>DSS interface, output and coupling</b>	<ul style="list-style-type: none"> <li>• <b>Tailor the output of DSS's to the user's needs:</b> Modification of existing interface of DSS's to allow easy selection of specific output in particular calculation points and export of results to other formats;</li> <li>• <b>Coupling</b> of the existing strategic DSS such as ARGOS and RODOS <b>to Command and Control (C2) systems.</b></li> <li>• <b>Study on optimising exchange of information:</b> covering all aspects of data exchange throughout emergency response and recovery.</li> </ul>	Projects: BOOSTER
<b>Serious gaming</b>	<ul style="list-style-type: none"> <li>• <b>Development of virtual and augmented reality to train the emergency response actors</b> (first responders, competent authorities, decision makers...);</li> <li>• <b>Other types of serious gaming for exercise/training support.</b></li> </ul>	Projects: TERRITORIES

### Research area 3. Challenges in setting-up a trans-disciplinary and inclusive framework for preparedness for emergency response and recovery

The following key topics and subtopics are defined:

Area 3. Key topics	Sub-topics
<b>Key topic 7. Emergency response and recovery framework, including reference levels</b>	Implementation of BSS including reference levels and relation with operational levels Governance of preparedness Long term management Contaminated goods Integration in all-hazard approach Exercises and drills
<b>Key topic 8. Stakeholder engagement, involvement of the public &amp; communication</b>	Stakeholder engagement processes including the public Communication Citizen Science
<b>Key topic 9. Integrated emergency management – non-radiological aspects (health surveillance, ethical aspects, economic issues, etc.)</b>	Health Surveillance Ethical aspects Socio-economic aspects Integrated surveillance and monitoring Accident waste management Radiological protection culture
<b>Key topic 10. Uncertainty and incomplete information handling</b>	Deal with, manage and address uncertainties in the decision making process Communication of decisions under uncertainty Train decision makers to better deal with uncertainties

### Key topic 7. Emergency response and recovery framework, including reference levels

**Objective:** Development of radiological decision criteria and implementation frameworks to improve and ensure the sustainability of emergency response and recovery management, addressing societal and ethical issues.

**Expected results:** Operational radiological decision criteria and guidance for implementation taking into account societal and ethical issues, and management framework for improve sustainable emergency response and recovery.

### Key topic 8. Stakeholder engagement, involvement of the public & communication

**Objective:** Improve the efficiency and social robustness of emergency response. Ensure that stakeholders are involved in decisions that impact their lives.

**Expected results:**

- ▶ Maintain the inclusion of social aspects of emergency response and stakeholder engagement;
- ▶ Greater recognition of the importance of stakeholder and public engagement;
- ▶ Improve understanding of the factors and criteria for successful stakeholder engagement;
- ▶ Improved preparedness for media and social media communication.

### Key topic 10. Uncertainty in the decision making processes

**Objective:** Improve the capabilities to perform sensible and robust decisions at all levels under high uncertainty. (This includes communication and visualisation of uncertainties in model results but also the consideration of how uncertainties are used when making decisions).

**Expected results:** Improved (communication) tools to present uncertainties in model results and tools and methods to include this information in the decision making process.

Sub-topic	Description and current research challenges within this (sub)topic	Relation with current projects and other SRA's
<p><b>Deal with, manage and address uncertainties in the decision making process</b></p>	<ul style="list-style-type: none"> <li>• Identify key information that should be considered for decision-making in the various phases of an emergency and develop indicators that indicate the usefulness of model results for decisions in the different phases, e.g. robustness or quality indicators;</li> <li>• Based on the needs for decision making initiate studies on model sensitivity, validity of model results and inter-comparisons of models with measurements to better judge the quality of model results for decision-making;</li> <li>• Investigating overall uncertainties and how uncertain model results can be better integrated into decision support systems to help decision makers to fully assess the radiological situation;</li> <li>• Investigate how uncertainties influence optimization process of management strategies,</li> <li>• Further develop formal decision aiding tools such as Multi Criteria Decision Analysis to integrate uncertain information from model result and uncertain preferences of decision makers;</li> <li>• Explore agent based simulation systems to systematically study the decision making process under different aspects such as composition of team, preference settings, constraints, and blockage of consensus seeking.</li> <li>• Investigate how local actors and non-institutional stakeholders make sense of uncertainty in their own decision-making processes and what governance mechanisms can facilitate these processes.</li> </ul>	<p>Projects: CONFIDENCE, TERRITORIES</p>

<b>Train decision makers to better deal with uncertainties</b>	<ul style="list-style-type: none"> <li>• Develop education and training material for decision makers on uncertainty management;</li> <li>• Investigate to which extent serious gaming or other modern IT-tools can be used for training of first responders and decision makers.</li> </ul>	Projects:  CONFIDENCE

## 5. CROSS-CUTTING TOPICS

### 5.1. Education and training

Education and training is an essential part of any Strategic Research Agenda both for guaranteeing high level research in the field as well as for transfer of knowledge gained through research and development towards the operational field of nuclear and radiological emergency preparedness and other stakeholders. Maintenance of the range of expertise vital to keep up competence and run an effective Programme of research into radiation protection in general and specifically in nuclear and radiological emergency preparedness, response and recovery has been identified to be critical. Specific Programmes aiming at knowledge management across generations are designed in order to achieve sustainable continuity and development. The NERIS supported early and late phase emergency courses (organized respectively by the SCK•CEN Academy and CEPN) described in Annex 3 and organized since many years in different frameworks are essential parts of such a Programme. In addition to this basic courses in nuclear emergency, preparedness and recovery specific courses, organized within the E&T activities under the CONCERT umbrella, are important. Especially the “Assessment of long-term radiological risks from environmental releases” organised by the Technical University of Denmark and the travel grants for participation of young scientists in workshops and conferences in the field, such as the yearly NERIS workshop and the European radiation Protection Week.

The initiative was taken to organize during the yearly NERIS workshop a young scientist award with the goal to promote presentations by and participation of young scientist in the Workshop.

The ARGOS and RODOS user groups, described in Annex 4, offer also good training opportunities in the technical aspects of both decision support system, crucial to get started with the use of these systems.

### 5.2. Safety and security related activities

Radiation and nuclear safety and (radiation and nuclear) security have a common goal — the protection of people, society and the environment. In both cases (safety and security), such protection is achieved by preventing a large release of radioactive material. Many of the principles to ensure protection are common, although their implementation may differ. Moreover, many elements or actions serve to enhance both safety and security simultaneously. For example, the containment structure at a nuclear power plant serves to prevent a significant release of radioactive material to the environment in the event of an accident, while simultaneously providing a robust structure that protects the reactor from a terrorist attack. Similarly, controls to limit access to vital areas not only serve a safety function by preventing or limiting exposures of workers and controlling access for maintenance to qualified personnel, but also serve a security purpose by inhibiting unauthorized access by intruders.

The IAEA defines safety and security in the following way (IAEA 2007):

- ▶ **(Nuclear) safety:** “The achievement of proper operating conditions, prevention of accidents or mitigation of accident consequences, resulting in protection of workers, the public and the environment from undue radiation hazards.”;
- ▶ **(Nuclear) security:** “The prevention and detection of, and response to, theft, sabotage, unauthorized access, illegal transfer or other malicious acts involving nuclear material, other radioactive substances or their associated facilities.”

Stemming from their different historical roots, the areas of safety and security have long been treated within separate research communities with their own terminologies and methods. But since almost all systems today are connected to global networks, safety and security have become very much interdependent, meaning that safe systems also need to be secure and vice versa. Recent terrorist events have served as a catalyst for the development of an array of new nuclear security arrangements. Although concern about malicious acts involving nuclear installations is not new, recent terrorist events have demonstrated that an attack on a nuclear facility might be attempted and that terrorists have formidable capabilities and

dedication. This has led to an increased focus on defences against terrorists at nuclear facilities, as well as at other critical infrastructures. The development of revised security arrangements arises at a time when the public expects high standards of nuclear safety and security to be met. The challenge in meeting these expectations is predicted to grow in light of the interest in the new construction of nuclear power plants. In the Seventh Framework Programme (FP7) of the European Commission, security related research is centred in the Security Programme and radiation and nuclear safety research in the Euratom Programme ([http://cordis.europa.eu/fp7/home\\_en.html](http://cordis.europa.eu/fp7/home_en.html)).

As noted above, the fundamental goal of safety and security actions is the same — the protection of people, society and the environment. The acceptable risk is presumptively the same whether the initiating cause is a safety or a security event. Moreover, the philosophy that is applied to achieve this fundamental objective is similar. Both safety and security typically follow the strategy of defence in depth — that is, the employment of layers of protection. The fundamental nature of the layers is similar. Priority is given to prevention. Second, abnormal situations need to be detected early and acted on promptly to avoid consequent damage. Mitigation is the third part of an effective strategy. Finally, extensive emergency planning should be in place in the event of the failure of prevention, protection and mitigation systems. The steps taken to provide protection against malicious acts incorporate specific features to ensure physical protection, but also rely on provisions that may have been installed for safety reasons.

NERIS Platform follows and recommends the R&D activities both in the safety and security areas and encourages scientists in these areas to collaborate with each other to achieve the best possible impact of research in nuclear and radiological emergency management.

### **5.3. Collaboration with other platforms**

The NERIS Platform creates close co-operation relationships with other research platforms in the areas of radiological protection and nuclear safety in Europe. It is of special importance to follow R&D and collaborate in the areas of radioecology, biological effects of exposure to ionizing radiation and epidemiology, and dosimetry and medical issues. This is guaranteed by the integration and active involvement of NERIS in the ‘CONCERT-European Joint Programme for the Integration of Radiation Protection Research’ under Horizon 2020. NERIS also signed in 2013, a Memorandum of Understanding with the European research platforms in the domain of radiation protection (MELODI, ALLIANCE and EURADOS). In addition, for developing and implementing its SRA, NERIS has established interactions with different European and International organisations involved in radiation protection. The main research platforms and organisations interacting with NERIS are the following:

**European Radioecology Alliance**, (<http://er-alliance.eu/>) was founded in 2009 to strengthen European R&D in the area of radioecology. Radioecological studies are of special importance to assessment and management of nuclear or radiological emergency response and recovery, notably for developing Decision Support Systems (DSS) and addressing scientific issues associated with environmental contamination and countermeasure strategies. Reliability of environmental models used in emergency and recovery depends on radioecological parameters incorporated in the models. The Radioecology Alliance focuses not only on radiological protection of humans, but also on protection on wildlife. This aspect has to be taken into account in nuclear and radiological emergencies.

**MELODI** (Multidisciplinary European Low Dose Initiative, <http://www.melodi-online.eu/>) is an European Platform dedicated to low dose radiation risk research, founded in 2010 as a registered association with currently 30 members. MELODI aims at identifying R&D priorities for Europe in its field of competence and seeking the views of stakeholders on the priorities for research, keeping them informed on progress made, and contributing to the dissemination of knowledge. Since MELODI focuses on better understanding the health effects of exposure to low dose ionising radiation, its work is directly linked with the work of NERIS when protective measures in response to and recovery from nuclear and radiological emergencies are discussed. NERIS closely follows the work of MELODI and investigates how new findings of MELODI could be implemented in the European emergency management procedures.

**EURADOS** (European Radiation Dosimetry Group, <http://www.eurados.org>) is a network of more than 60 institutions and more than 500 scientists from the European Union, Switzerland, Eastern and Central Europe. It serves the promotion of research and development and European cooperation in the field of the dosimetry of ionizing radiation. The scope of EURADOS includes the fields of radiation protection, retrospective dosimetry, environmental radiation monitoring, radiobiology, radiation therapy, diagnostic and interventional radiology. Its activities promote technical development and its implementation into routine and contribute to compatibility within Europe and conformance with international practices. Dosimetry and monitoring issues are part of the management of emergency and recovery. NERIS follows the current developments in this field to improve preparedness.

**EURAMED** (European Alliance for Medical Radiation Protection Research), created in 2015, represents a consortium of associations involved in the application of ionising radiation in medicine, with the goal of jointly improving medical care and its radiation protection issues through sustainable research efforts. The main objective of this collaboration is improve the application of ionising radiation in medical care by developing and exploring common research strategies and by actively promoting the translation of results into clinical practice. Several topics have to be considered with EURAMED for better addressing medical issues in the case of a nuclear accident. NERIS is currently engaging a discussion with EURAMED in this perspective.

**SHARE** (Social Sciences and Humanities in Ionising Radiation Research) Building a more robust role for SSH in Ionising Radiation (IR) is imperative. This would open vital opportunities for multiple research communities to integrate social and ethical considerations into IR research, thereby expanding research options, clarifying values, and fostering collaborative approaches to research and innovation. The Platform will ensure that: i/existing and future research, policy and practice, in all areas relating to IR, can better take into account the concerns, values and needs of a wider range of stakeholders, including citizens and communities; ii/ the findings of social sciences and humanities (SSH) research can be better co-ordinated and also be better integrated in European research and development on IR; iii/research relating to IR will be conceived as transdisciplinary and inclusive, integrating technical and non-technical inputs from the start.

#### 5.4. Collaboration with European and International Organizations

**HERCA** (association of the Heads of European Radiological protection Competent Authorities, <http://www.herca.org/>) is a collaboration forum of the European radiation protection authorities, founded in 2007. HERCA has recognized the need for a more harmonised approach with regard to the management of nuclear and radiological emergency situations as a top priority. HERCA has also recognised that the events at the Fukushima Daiichi NPP in March 2011 dramatically illustrate that similar needs for a common understanding and, whenever possible, a common approach in the field of nuclear emergency response also exist for accidents happening even at great distance from Europe. National radiation protection authorities are the key players in nuclear and radiological emergencies and therefore the objectives of HERCA and NERIS are common. NERIS is the forum where new methods and tools are developed and the radiation protection authorities, among the others, take care of implementing them. Therefore it is of primary importance that these two forums work closely together.

**ICRP** (International Commission on Radiological Protection, <http://www.icrp.org>), created in 1928, helps to prevent cancer and other diseases and effects associated with exposure to ionising radiation, and to protect the environment. ICRP is an independent, international organisation with more than two hundred volunteer members from approximately thirty countries across six continents. These members represent the leading scientists and policy makers in the field of radiological protection. ICRP has developed, maintained, and elaborated the International System of Radiological Protection used world-wide as the common basis for radiological protection standards, legislation, guidelines, programmes, and practice. NERIS is recognised as liaison organisation by ICRP and participates each year to the exchange meetings to identify the main challenges for the application of the radiological protection system in emergency and recovery situations.

**IAEA** (International Atomic Energy Agency, <https://www.iaea.org>) was created in 1957 in response to the deep fears and expectations generated by the discoveries and diverse uses of nuclear technology. Widely known as the world's "Atoms for Peace" organization within the United Nations family, the IAEA is the

international centre for cooperation in the nuclear field. The Agency works with its Member States and multiple partners worldwide to promote the safe, secure and peaceful use of nuclear technologies. Specific developments have been made following the Chernobyl and Fukushima accidents and regular meetings are organised, leading to publications and recommendations for the management of emergency and recovery. NERIS interacts regularly with IAEA to exchange information and identify areas where NERIS researches can be disseminated.

**IRPA** (International Radiation Protection Association, <http://www.irpa.net>) is the international association of the national societies of radiation protection. It aims to provide a medium whereby those engaged in radiation protection activities in all countries may communicate more readily with each other and through this process advance radiation protection in many parts of the world. NERIS interacts more specifically at the occasion of the international and regional congresses, providing an opportunity to present and discuss the results of research developments among the community of radiation protection experts.

**NEA** (The Nuclear Energy Agency) is an intergovernmental agency that facilitates co-operation among countries with advanced nuclear technology infrastructures to seek excellence in nuclear safety, technology, science, environment and law. The NEA, which is under the framework of the Organisation for Economic Co-operation and Development, is headquartered in Paris, France.

**WHO** (World Health Organization) The WHO is building a better, healthier future for people all over the world. Working with 194 Member States, across six regions, and from more than 150 offices, WHO staff are united in a shared commitment to achieve better health for everyone, everywhere. Together we strive to combat diseases – communicable diseases like influenza and HIV, and noncommunicable diseases like cancer and heart disease. We help mothers and children survive and thrive so they can look forward to a healthy old age. We ensure the safety of the air people breathe, the food they eat, the water they drink – and the medicines and vaccines they need.

**NUGENIA** (NUclear GENeration II & III Association). Established in 2011, **NUGENIA is an international non-profit-making association** according to the Belgian law of 1921, headquartered in Brussels. Today, **we gather more than 100 members worldwide** to advance the research and development of nuclear fission technologies, in particular for Generation II and III nuclear plants. The association aims to be an integrated framework for R&D to **ensure safe, reliable and competitive Gen II & III fission technologies** by: i/ Fostering collaboration between industry, SMEs, research organisations, academia and technical safety organisations; ii/ Building knowledge and expertise and iii/ Generating R&D results with added value for the nuclear community

**EC-DG-JRC** (European Commission - Directorate General - Joint Research Centre). The Joint Research Centre is the Commission's science and knowledge service. The JRC employs scientists to carry out research in order to provide independent scientific advice and support to EU policy.

**EC-DG-ENER** (European Commission - Directorate General – Energy) This Commission department is responsible for the EU's energy policy: secure, sustainable, and competitively priced energy for Europe.

## **6. WAY FORWARD**

The vision of the NERIS Platform is that all European organizations being involved in nuclear emergency management and recovery are sharing common views and common approaches as well as, developing and using state-of-the-art compatible technology and methods for consequence management of the emergencies. This vision presumes commitment of all key players in a joint European approach and existence of necessary technology and methods to be applied in response to and recovery from an emergency situation. Mission of the NERIS Platform is to encourage European, national, regional and local authorities, technical support organisations (TSOs) and other players to co-operate to achieve this vision. The aim is to get national players in different European countries to act in a coherent way in order to avoid confusion and to enhance confidence among the population. Role of the European Commission and other bodies having a mandate to establish binding arrangements in management of nuclear and radiological emergencies and recovery have a central role in achieving more coherent European approach.

The NERIS Platform itself shall have a clear vision of what development is needed to achieve a functioning European emergency response and recovery arrangements. The Strategic Research Agenda should include these needs. The SRA is a living document. This is the third update and the platform shall always update it at more or less regular intervals. The Key Topics in the future research and development are identified in this SRA and the Platform will go all out for getting these topics in the appropriate European research programmes in the coming years. Of course, engagement of the European Commission in the process is extremely important.

## **7. CONCLUSION**

A NERIS SRA defines ten key topics in three research areas. The three areas are seen as equally important to achieve the overall goals in nuclear emergency preparedness, response and recovery. All defined key topics require further R&D. Specific challenges are largely based on the previous versions of the NERIS SRA, but substantial changes were made to take into account the progress made in the different R&D projects currently running and that have recently been concluded. Priorities are not defined in this document and all challenges are identified as important. Further prioritization has been done in NERIS statements, in the context of CONCERT or in the NERIS roadmap. The relation with other European radiation protection platforms (MELODI, ALLIANCE, EURADOS, EURAMED and SHARE) and EU projects addressing part of the topics have also been indicated.

## **9. ANNEX 1. Previous SRA versions**

Three previous versions of the NERIS SRA has been published on the NERIS website:

- Strategic Research Agenda of the NERIS Platform, SRA-Report-v2.pdf, published on 30 March 2012
- Strategic Research Agenda of the NERIS Platform - v2, NERIS\_SRA\_version4\_22122017.pdf, Published on 22 April 2014
- Updated version of the NERIS SRA - December 2017, NERIS Roadmap\_20\_november\_2017.pdf, Published on 09 January 2018

## 10. ANNEX 2. NERIS RELATED RESEARCH PROJECTS

### NERIS-TP

The NERIS- TP Project (2011-2014) aimed on the one hand to keep the momentum gained through the European Project EURANOS in establishing a platform where the operational and research community can meet and discuss with all the relevant stakeholders the topics related to emergency response and recovery preparedness and on the other hand to tackle urgent research topics in the area of nuclear emergency response and recovery preparedness. Through a collaboration of industry, research and governmental organisations in Europe, methodological aspects and computational models have been developed to be consistent with recommendations from international bodies such as the ICRP (International Commission for Radiological Protection) and improve Europe's response by coupling decision support systems with an emergency information system such as the European wide information system ECURIE. Within this project, the NERIS platform was established as a unique place for combined meeting of the research and the operational community.

### FP7-project PREPARE (Innovative integrative tools and platforms to be prepared for radiological emergencies and post-accident response in Europe) - Finished

The European research project PREPARE ended in January 2016 and brought together 46 partners from Europe and Japan. The objective was to close gaps identified after the Fukushima accident. The following results have been obtained:

- ▶ Atmospheric modelling:
  - First prototype of inverse source term estimation modules (released activities, isotopic composition, height) through data assimilation of near or far field measurements;
  - Improvements in the speed of calculation allowing to use them for long lasting releases;
  - Improved deposition modelling of particles with spectrum of different sizes and densities.
- ▶ Aquatic modelling:
  - Improved models for coastal areas;
  - Improved run-off modelling, however still very limited;
- ▶ Data mining, information gathering and providing information to stakeholders and mass media:
  - Analytical Platform for data exchange;
  - Knowledge data base – so far limited to the early phase, but work in HARMONE will deal with the later phase;
  - Trustworthiness of information.
- ▶ Stakeholder engagement and dialogue:
  - Contaminated goods.
- ▶ Social media/networking technology:
  - Public behaviour;
  - How the public obtains information;
  - Factors important for trust.

### **OPERRA-project CATHyMara (Child and Adult Thyroid Monitoring after Reactor Accident) - Finished**

The Cathymara project aims at setting-up guidance for monitoring the internal contamination in the case of a large scale nuclear accident, with a focus on the measurement of I-131 content in the thyroid, especially for children and included:

- ▶ Evaluation of existing response capabilities for thyroid monitoring in Europe in case of a large scale accident;
- ▶ Harmonization of measurement practices and establishment of a robust protocol in case of the need to monitor children;
- ▶ Setting-up the basis for a sustainable network of responders, including trained but non-specialized operators;
- ▶ Studying to what extent the total committed effective dose (internal dose) can be evaluated from I-131 measurements and the development of emergency oriented dose assessments methods;
- ▶ Developing the optimal monitoring strategy, including guidelines and recommendations.

### **OPERRA-project HARMONE (Harmonising Modelling Strategies of European Decision Support Systems for Nuclear Emergencies) - Finished**

The HARMONE project started December 1, 2015 and aimed to reduce scientific, methodological and operational gaps identified in the strategic research agendas of the four European Platforms in the area of radiation protection and issued as TOPIC 2 of the OPERRA-2014 Call: “Spatial and temporal environmental modelling and human dose assessment after a nuclear accident”. This included the following work activities:

- ▶ Development of a knowledge data base and guidance that allows, according to the first event description, to propose a first management strategy to reduce doses and highlights potential issues for the dose assessment;
- ▶ Refinement of simulation models for all exposure pathways to obtain a better assessment of the total dose. This would include also a methodology for the regionalisation of the model to have assessments on all relevant scales;
- ▶ Development of guidelines for dose monitoring to back-up the first two steps and facilitate the refinement of the simulations.

### **OPERRA-project SHAMISEN (Nuclear energy situations – Improvement of medical health surveillance) - Finished**

The aim of the project is to build upon the experience and feedback from Chernobyl, Fukushima and other emergency situations to develop recommendations for health surveillance and medical follow-up of affected populations for:

1. Dose assessment in support of emergency response, clinical decision-making in the aftermath of a radiation accident, and long-term follow-up of exposed populations;
2. Improvement of living conditions of affected populations, responding to their needs, and engaging them in surveillance programmes without generating unnecessary anxiety; and
3. Improvement of population estimates of radiation-induced risk both for radiation protection and for communication with affected populations, if and where feasible.

Five complementary subtasks (ST) have been executed: ST1 focuses on learning from radiation accidents; ST2 looks at the needs of populations by way of case-studies; ST3 will develop recommendations for health surveillance aimed at improving living conditions of affected populations and knowledge on health effects; ST4 focuses on cross-cutting issues (stakeholder engagement, ethics, and economics of health surveillance); and ST5 is dedicated to efficient project management.

### **BOOSTER (BiO-dOSimetric Tools for triagE to Responders)**

The BOOSTER project, gathering seven partners from five different countries, addressed the effective management of an event involving the exposure of numerous people to radioactive material, whether accidental or following a malevolent act, requiring a mechanism for rapid triage of exposed individuals. A unique toolbox was developed that allowed to quickly assess the radiological situation in the field and to provide fast and reliable biodosimetric tools to Triage Teams to evaluate the radiological dose received by each victim. This allows to speed up the categorisation of the triage and provided material for any potential further follow-up.

The BOOSTER System architecture was designed to fit the current procedures for radiological crisis management, generally based on the definition of different areas around the scene. An exclusion area and a controlled area are defined based on radioactivity levels measured in these zones. The equipment used in the controlled area allows the cartography of the radiological situation and therefore the real-time assessment of the dose received. In the Decontamination area, victims are controlled for contamination and a decontamination process is applied if necessary. Several measurement devices are deployed to assess the level and position of external contamination on individuals.

When affected people arrive to the Support area, a deeper analysis is performed for radiological triage. A complete kit for a first determination of the dose received by internal contamination and irradiation is installed in the Support area: Low-Background Spectroscopy on biological samples and environment samples, portable LIBS analysis of biological samples, retrospective dosimetry using environment samples and SMD resistors from cell phones, biodosimetry using  $\gamma$ H2AX quantification. All results, obtained in less than 20 min, are linked with the victim ID and stored in a database processed by Decision Support System for triage instructions and medical care.

As supporting tools two easily deployable DSS systems consisting in rugged laptop with SIMACOP and RODOS applications are available for crisis managers and authorities, to show all information from the Controlled area as well as second level information from the Support area.

The BOOSTER equipment was demonstrated at Budapest on May 16, 2013, to present all the techniques developed during BOOSTER project and their final integration.

### **CONFIDENCE COping with uNcertainties For Improved modelling and DEcision making in Nuclear emergenCIes**

The H2020 CONFIDENCE Project aims to address existing gaps in several areas of emergency management and long-term rehabilitation. It concentrates on the early and transition phases of an emergency, but considers also longer-term decisions made during these phases. The work-programme of CONFIDENCE aims to understand and, if possible with the given resources, to reduce and cope with the uncertainty of meteorological and radiological data and their further propagation in decision support systems, including atmospheric dispersion, dose estimation, foodchain modelling and countermeasure simulations models. Consideration of social, ethical and communication aspects related to uncertainties is also considered. First attempts will be made to combine simulation with monitoring to help gaining a more comprehensive picture of the radiological situation. Decision making principles and methods will be investigated to understand the need for uncertainty handling in the decision making process. A comprehensive education and training programme is linked with the research activities.

### **TERRITORIES To Enhance unceRtainties Reduction and stakeholders Involvement TOwards integrated and graded Risk management of humans and wildlife In long-lasting radiological Exposure Situations**

The TERRITORIES project targets an integrated and graded management of contaminated territories characterised by long-lasting environmental radioactivity, filling in the needs emerged after the recent post-Fukushima experience and the publication of International and European Basic Safety Standards. A graded approach, for assessing doses to humans and wildlife and managing long-lasting exposure situations (where radiation protection is mainly managed as existing situations), will be developed through reducing uncertainties to a level that can be considered fit-for-purpose. The overall outcome will be a first attempt to

provide an umbrella framework, that will constitute the basis to produce, and disseminate, novel guidance documents for dose assessment, risk management, and remediation of NORM and radioactively contaminated sites as the consequence of an accident, with due consideration of uncertainties and stakeholder involvement in the decision making process.

### **ENGAGE: ENhancinG stAkeholder participation in the GovernancE of radiological risks for improved radiation protection and informed decision-making**

ENGAGE seeks to identify and address key difficulties and opportunities for stakeholder engagement in three fields of exposure to ionising radiation: i/ medical use of ionising radiation, ii/ post-accident exposures, and iii/ exposure to indoor radon. The ENGAGE project is part of CONCERT European Joint Programme for the Integration of Radiation Protection Research' under Horizon 2020.

### **SHAMISEN SINGS project - Stakeholder INVOLVEMENT in Generating Science after Nuclear Emergencies**

SHAMISEN-SINGS, building on the recommendations of the EC-OPERRA funded SHAMISEN project, aims to enhance Citizen Participation in preparedness for and recovery from a possible radiation accident through the evaluation and development of novel tools and APPs to support data collection on radiation measurements, health and well-being indicators.

The project's goals:

- ▶ Interaction with stakeholders to assess their needs and interest in contributing to dose and health assessment through the use of new technologies, for example, mobile applications (APPs);
- ▶ Review of existing APPs for citizen-based dose measurements and for health monitoring, establishing minimum standards of quality. Develop a core protocol for a possible citizen-based study on health, social, and psychological consequences in the case of a radiation accident;
- ▶ Develop the concept/guidelines for one or more APPs that could be used to monitor one's radiation dose (possibly contributing to radiation exposure assessment after an accident including visualisation of real-time radiation conditions), and log behavioural and health information. In addition to contributing to citizen science studies, these Apps would be designed to provide a channel for practical information, professional support and dialogue, as needed by stakeholders.
- ▶ Address ethical issues related to the use of these Apps through a consensus workshop.

## **11. ANNEX 3. NERIS supported training courses**

### **Preparedness and response for nuclear and radiological emergencies**

The course on "Preparedness and response for nuclear and radiological emergencies" addresses the state of the art in nuclear and radiological emergency management including the latest international recommendations, the lessons learned from the Fukushima accident and the challenges we still face. The main objective is to provide fundamental knowledge and practical advice to all actors involved in emergency planning and response. Main topics in the course are the principles of intervention; radiological evaluations; decision-support tools; different aspects of planning and organization in off-site emergency response; economic, social and psychological impact; European Community legislation; and international data and information exchange. The course is organized by the SCK•CEN Academy for Nuclear Science and Technology, in collaboration with the main European emergency management actors and the European platform NERIS (Preparedness for Nuclear and Radiological Emergency Response and Recovery). It is building on over 20 years of organizing this international course in different frameworks and it is organised on a yearly basis: see [https://academy.sckcen.be/en/Customised\\_trainings/Open\\_courses/Open\\_emergency](https://academy.sckcen.be/en/Customised_trainings/Open_courses/Open_emergency)

### **Late Phase Nuclear Accident Preparedness and Management**

The Training Course on "Late Phase Nuclear Accident Preparedness and Management" is organised by the Nuclear Protection Evaluation Center (CEPN - France) and the Institute of Radiology (RIR - Belarus) in cooperation with the European platform NERIS on emergency and post-accident preparedness and response. The training course is co-funded by the European Joint Program for the integration of radiation protection research CONCERT. The main objective of the course for late phase nuclear accident preparedness and management is to provide principles and practical guidance for the key players involved in the preparedness and recovery of living conditions in contaminated areas in the aftermath of a nuclear/radiological accident.

The course offers a comprehensive overview of the various dimensions and challenges of the long-term rehabilitation. It includes also practical elements for the implementation of countermeasures for managing long-term contaminated rural and urban environments, notably through the planning of direct meetings and dialogue with local stakeholders (inhabitants, pupils, local authorities, etc.) living in the areas affected by the Chernobyl accident.

The course is based on international recommendations and on the material produced and developed in several European and international projects: ETHOS, SAGE, FARMING, CORE, EURANOS, NERIS TP, etc. as well as the first results obtained under PREPARE and SHAMISEN programs. The course is made of lectures, practical working sessions, technical visits and discussions. It strongly relies on the practical experience of Belarussian organisations in the management of the Chernobyl consequences as well as on the first lessons from the management of the consequences of the Fukushima accident.

## 12. ANNEX 4. User groups - Decision Support Systems

### The ARGOS Consortium

PDC (Prolog Development Centre) and DEMA (Danish Emergency Management Agency) originally developed the ARGOS system to be used for CBRN(E) Emergency Preparedness and Response. In 2001 the ARGOS Consortium was founded to give other organizations the possibility to use ARGOS and participate in the further development. The purpose and mission of the ARGOS Consortium is to establish a forum for exchanging knowledge and ideas about the use of ARGOS, and to further develop the system to become the best possible tool for emergency preparedness and response. The Consortium arranges annual meetings where all members have the opportunity to influence the development of the system. New ideas and cases are discussed and the members decide on which new facilities to develop, which new models to include, etc. This way, the ARGOS Consortium ensures a user driven development of ARGOS. New members can enter the Consortium and get access to ARGOS license free - but there is an annual member fee that covers future developments and maintenance. ARGOS integrates and relies heavily on models from several Consortium Partners. ARGOS supports emergency management organizations in 13 countries covering more than 400 million people worldwide.

### The RODOS user group

The RODOS Users Group (RUG) has the following objectives

- To provide a platform through which the members of the RUG can communicate their views, needs and comments and exchange their experience related with all elements of the RODOS system and its use, in particular provide response and guidance on refinements to make the system more user friendly and for any future developments of RODOS.
- To share experience gained while integrating RODOS in the national emergency management arrangements, and to enable RUG members to enhance their own arrangements.
- To identify best practices, to share technical know-how and organisational solutions, software developments and data bases and their implementation, and to provide mutual support, particularly on a regional basis.
- To share practice and solutions related with use of RODOS for training and in exercises.
- To provide a forum through which the members of the RUG can network with each other, independent of the RUG's activities.
- To establish contacts to the User Groups of other decision support systems within Europe (e.g. ARGOS) and overseas.
- Strive at reaching compatibility of the RODOS system with other decision support systems.
- To ensure sustainability of the RODOS decision support system through the establishment of maintenance procedures and sustainable arrangements between the users and the developers.
- Promote the use of RODOS in Europe.

RODOS user group meetings are organized on a yearly basis and last in general for 2 days. In general a European RODOS user hosts the meeting.
